P2PaLA Train Parameters

Training Parameters for the P2PaLA structure tool (under construction)

Structure types

These are the structure types that are tagged using Transkriubs on *region* level. Do *not* use whitespace in those structure types and be careful with case sensitivity, i.e. we recommend using only lowercase letters. Also we recommend to use dashes (-) and underscores (_) as the only special character, although other may work too.

Example:

```
paragraph heading footnote page-number
```

Merged structure types

Merged structure types are used to treat certain structure types the same as others during training (e.g. 'footnote-continued' or 'footer' like 'footnote'). Expected is a list of the structure types, separated by a colon with the structure types to merge.

Example:

```
footnote:footnote-continued,footer heading:header
```

Here, regions tagged with 'footnote-continue' and 'footer' are regarded as 'footnote' while 'header' is regarded as 'heading' during training.

Training Mode

You can specify whether the model should be able to detect (text-)regions, baselines or both.
